A strain for every effort.

Here's living proof that we can lend a strain of our own to any research effort.

Our CD outbred albino is a proven standout in toxicology, endocrinology and pharmacology.

A one-of-a-kind performer, our CDF Fischer 344 is noted for homozygosity. It delivers near identical physiological data again and again and again.

Our other inbred, the CD Wistar/Lewis, is perfect for adjuvant arthritic and other inflammatory studies. It's a uniquely sensitive research model and COBS® like all the rest.

Write or call for information on any or all of our three rat strains. We'll be happy to tell you more. In fact, it's no strain at all.

Charles River
THE JOURNAL OF IMMUNOLOGY®

Information for Subscribers

Published monthly, beginning January, 1929. (From the 1916-1925, and in 1928 Volumes I-X inclusive, and Vol. XV published bi-monthly.)

The subscription price is $48.00 per year in U.S.A.; $51.00 elsewhere. Single copies, when available, are $5.00 in U.S.A.; $5.25 elsewhere. The subscriptions of members of the American Association of Immunologists are included in the membership dues and are handled by the Association's Treasurer, Dr. Henry Metzger, American Association of Immunologists, 9650 Rockville Pike, Bethesda, Md. 20014. All other subscriptions should be sent to the publishers.

Change of address: Publisher must be notified 60 days in advance. Journals undeliverable because of incorrect address will be destroyed. Duplicates can be obtained (if available) from the publisher at the regular price of single issues.

New subscriptions and renewals are entered to begin with the issue scheduled for publication 60 days after receipt of the order, unless otherwise requested.

Subscriptions should be renewed promptly: To avoid a break in your series, subscriptions should be renewed promptly. The publishers cannot guarantee to supply back issues on belated renewals.

Microfilm. For availability, inquire of The Williams & Wilkins Company.

Reprints of individual articles are available only from authors.

We have the best medical dictionary

STEDMAN'S 22

That may sound like a big claim—but we believe you'll agree with us when you use the brand new 22nd edition of Stedman's Medical Dictionary.

And we know you will want to use it, because it is the most authoritative, most comprehensive, and most up-to-date reference book the physician, medical student or researcher can buy. That's why we've invested seven years in revising, expanding, redesigning and rethinking our good old dictionary. Thirty-four experts have worked on the forty-four specialties for an average of three years apiece. (Where else can you find an accumulated 102 years of current medical knowledge?) And to assist these human brains, we enlisted the services of a computer for overall editorial review. (Where else does a great past unite with today's technology?)

We think it's about time the medical profession had the best. So we're offering you our investment. Your investment in Stedman's 22 will pay off. We can promise you that. So order your copy today. You'll never regret it.

The facts about Stedman's 22

Our new dictionary contains 7,199 significant new vocabulary entries reflecting new information from 44 specialties and subspecialties in the life sciences; 24,877 important editorial revisions presenting new information on 30% of the vocabulary; excellent color plates and illustrations presenting graphic accompaniment for hundreds of vocabulary entries; an alphabetical index to subentries; appendices, tables, eponyms, synonyms; a medical etymology section; and to assist you in getting the most out of your dictionary—a special section written for just that purpose. Thumb-indexed for easy use, and beautifully bound, your new STEDMAN'S will be the most valuable addition to your library in years.

Basic Immunogenetics
By H. H. FUDENBERG, M.D., University of California School of Medicine, San Francisco and Berkeley; J. R. L. PINK, Basel Institute of Immunology; D. C. STITES, M.D., University of California School of Medicine, San Francisco; and A. C. WANG, University of California, San Francisco. This textbook is designed to advance from the simple to the complex. It treats such fundamental matters as the structure of a typical antibody molecule and the intrinsic heterogeneity of antibody preparations and their ability to distinguish subtle differences among intruding antigens. Chapters deal with the following topics: Immunoglobulin Structure and Evolution, Genetics of Immunoglobulin Molecules, Antibody Variability, Cellular Immunogenetics, and Human Blood Groups.
June 1972, 265 pp., 25 illus., cloth $7.95, paper $4.95

Principles of Pathobiology
Edited by MARIANO F. LA VIA, M.D., Emory University School of Medicine, and ROLLA B. HILL, JR., M.D., State University of New York, Upstate Medical Center. This volume presents the modern concept of pathology as an extension of normal biological principles rather than as a fundamental change in structure and function. "This is a commendable book in a field which is newly developed and basic to the study of disease."—W. H. Carnes, M.D., University of California School of Medicine, Los Angeles. "I found this text to be an excellent one which presents many of the recent basic concepts in the field of molecular biology."—Paul L. Wolf, M.D., Stanford University School of Medicine.
1971, 304 pp., 100 illus., cloth $11.50, paper $7.95

Color Atlas of Histopathology
SECOND EDITION
By R. C. CURRAN, M.D., University of Birmingham Medical School. Designed as a complement to textbooks in pathology, this volume provides the means for a careful study of histopathology, and a greater diversity of examples than some laboratories can supply. The Atlas features a selection of 765 skillfully prepared color plates that display sections of diseased cellular tissue. Explicit captions furnish the information essential to the study of the sections, and a full index covers all different types of cells, as well as lesions, to be viewed in the illustrations. The book is divided into fourteen chapters, treating different regions and systems of the body.
May 1972, 94 pp., 765 color photomicrographs, $15.50

CUSTOM ANTISERUMS
(prepared in rabbits or goats)

$3.00/ML MINIMUM 50 ML
$2.00/ML 150 ML or MORE

Antigens Supplied by Investigator

CUSTOM CONJUGATIONS
of Antiserums or Antigens

FLUORESCIN  RHODAMINE
FERRITIN  PEROXIDASE

$200.00 up to 50 ML

ALSO: Individualized custom conjugations to investigator’s specifications

Specialists in Fluorescein, Rhodamine, Ferritin and other chemical conjugations.

Q: Are you aware of the latest on the immunity reaction to organ transplants? Of animal research refining the “genetic rules” of transplantation? (If you’re working in transplantation—or studying it—can you afford not to be?)

A: Chances are, even if you are up-to-date there’s plenty of interest to you in Williams & Wilkins’ monthly journal, TRANSPLANTATION. (Like the “brief communications” on research here and abroad anticipating good work to come. Or abstracts of other important clinical papers.) The journal’s multidisciplinary audience is merged in a common effort. They expect the best news first in its pages. If you’re a researcher, clinician, resident or student in the field, join the loyal audience. Keep apace with the dynamic specialty.

TRANSPLANTATION:

Official journal of the Transplantation Society. Monthly, 2 volumes per year, $40 per year. To the intern, resident and student, a special “in training” rate: only $30 per year.

New Phadebas® IgE Test
makes IgE testing simpler, faster and more convenient than ever before possible

Radioimmunoassay
based on the solid phase Sephadex® principle

Complete reagents
sufficient for 50 determinations

Fast results
overnight incubation at room temperature

Wide range
measures serum levels 10 to 4000 U/ml

Pharmacia Laboratories Inc.
800 Centennial Avenue, Piscataway, New Jersey 08854

Please send me further information on the following Phadebas tests

The first commercially available isolator-derived HAMSTER is proudly announced by the leader in white rats and other gnotobiotic laboratory animals.

Through a process of treatment, caesarean section, foster suckling and isolator rearing a clean hamster has been produced. The unique characteristics of the golden hamster make this animal exceptionally well suited and valuable for certain types of biomedical research. Among such uses are: tumor growth in the cheek pouch, both homografts and heterografts; tissue transplantation, dental caries, studies in virology and bacteriology, aging, hibernation, cardiovascular research, pharmacology and nutritional studies.

Call or write for more details on availability and prices of this important addition to the ARS/Sprague-Dawley line of top quality laboratory animals.
