Test tubes to answers.
The complete radioassay systems.

Searle Analytic (formerly Nuclear-Chicago) offers you the only complete on-line radioimmunoassay/competitive protein binding (RIA/CPB) systems.

Systems that automate the entire radioassay procedure—from analyzing RIA/CPB samples to printing out immediate, meaningful results. You only load standards and samples, establish assay protocol, start the system, and retrieve final, hard copy answers. Our systems do all the rest!

Assay preparation isn’t changed at all. Yet answers are transformed directly to averaged count rate, normalized percent bound, standard deviation, dose, corrected dose, and confidence range for each sample group. It’s all performed by our RIA/CPB Data Processor, which can be linked to either our beta or gamma spectrometer systems. The combination provides unprecedented speed and convenience in data-reduction.

But we didn’t stop with immediate answers in RIA. For the wide variety of kits now in commercial use, our spectrometer systems let you program and count many combinations of tests in the same run. Or, with our exclusive SRA 2™ System, simultaneously operate both beta and gamma systems from a single RIA/CPB Data Processor.

Whatever the demand—raw RIA/CPB data, spectrometer systems for any use, or the right systems for your particular lab—we provide complete answers. You’ll find your questions answered in our free brochure, RIA/CPB Data Systems. Write to us today.

ALS-403
Complement Component Assays.

Cordis makes them practical. In your lab.

Assaying complement components is important. In diagnosing, monitoring, and managing a growing number of diseases.

But until Cordis developed its Complement Test Sets, measuring component levels meant time consuming procedures, difficult on-site preparation of reagents or radial immunodiffusion tests with inconclusive results.

The Cordis Complement Test Sets make it possible — and practical — for you to perform all nine complement component assays quickly and easily in your own laboratory. Functional hemolytic assays that measure specific activity of components (not just levels of protein).

Cordis Complement Test Sets offer:
Functional analysis through hemolytic assay. Simplified laboratory procedures. Quality-controlled reagents. All required items, including component reagents, stable cellular intermediates, buffers, and complete instructions.
Both sizes are produced to order under quality-controlled conditions to assure maximum reliability.
So add a vital new procedure to your laboratory capabilities: complement component assays, with Cordis Complement Test Sets.

Our Assay Service-

You may prefer to submit specimens to Cordis Laboratories for analysis by our highly specialized personnel. Cordis offers this Complement Component assay service for tube or microtiter plate procedures. Results are airmailed within three days after receipt of specimen. Please write for specimen mailing container and collection instructions.

For more information please write or call collect.

Affinity Chromatography

with spacer groups

AH-Sepharose® 4B
CH-Sepharose® 4B

for coupling ligands containing a free carboxyl or a primary amino group to the Sepharose matrix via a six carbon atom "spacer" group. AH-Sepharose 4B, with a terminal amine group, and CH-Sepharose 4B, with a terminal carboxyl group, substantially reduce the steric hindrance to binding which may occur when small ligands are coupled to the Sepharose matrix.

The ligands can be coupled directly to these "spacer" groups using a carbodiimide reaction, thereby reducing the number of synthesis steps required to make the adsorbent.

AH-Sepharose 4B, containing -(CH₂)₆NH₂ groups, and CH-Sepharose 4B containing -(CH₂)₅COOH groups, are available in packs of 15 g corresponding to a gel volume of 60 ml.

Con A-Sepharose®

Provides new possibilities for the isolation of glycopeptides, glycoproteins and polysaccharides by affinity chromatography. Concanavalin A has been coupled to Sepharose 4B by the CNBr method and reacts specifically with terminal D-mannose-like residues.

Con A-Sepharose is available in packs containing 100 ml sedimented gel, 800 mg bound concanavalin A.

and without

CNBr-activated Sepharose® 4B

is a ready activated matrix to which proteins and other molecules containing primary amino groups may be coupled directly. The procedure is quick, easy and safe, and preserves the binding activity of sensitive ligands.

CNBr-activated Sepharose 4B is the material of choice for the immobilization of macromolecules in the preparation of biospecific adsorbents for affinity chromatography. Its use in the study of proteins, nucleic acids, polysaccharides etc. is already well documented. Sepharose provides a matrix which is stable, has a high capacity even for very large molecules, and displays low non-specific adsorption.

Freeze-dried CNBr-activated Sepharose 4B is available in packs containing 15 g corresponding to a gel volume of 50 ml.

NEW CONVENIENCE... NEW FLEXIBILITY... IN IMMUNODIFFUSION TESTING

Mix or match any combination of tests with the new Hyland Immuno-Plate Multi-Test Tray

With this new Multi-Test tray you can convert any four Immuno-Plates, six- or twelve-well, into one easily handled combination plate. It not only makes managing tests easier, but gives you a far freer hand in fitting the test system to your exact needs.

With the addition of new plates for quantitation of Alpha1-Antitrypsin and IgE, there are now fifteen tests available. This gives you greater flexibility with hundreds of ways to combine tests on a single tray.

Or you can combine four of the same Immuno-Plates to make one large 48-well plate.

Hyland gives you all these advantages, plus precision production controls. Wide-spaced wells, raised plate bottoms and color coding provide accurate readings. Numbered wells allow for positive identification. Short incubation periods and long expiration dates are an added plus.

You have a headstart because Hyland was the pioneer developer of immunological reagents. Compare Hyland to any other system, old or new. It has to be the system of choice for convenience, flexibility and economy.

Let us give you a hand. Call Hyland or talk to our representative.

Full instructions for use are included with each package.

At Hyland we do more... so you have less to do.

search and clinical studies that conserves costly materials, time, and space...and that's not by chance. Durable plastic chambers attached to a glass slide by a removable gasket simplify work. No tubes. No dishes. No need to transfer cells. Avoids dangers of contamination. The start-to-storage system assures you of a readable permanent record because it's on the slide. Lab-Tek's good manufacturing procedures insure reproducible results. Lab-Tek® Tissue Culture CHAMBER/SLIDE is useful for growing clones, cell lines, and strains. We have many reports of how useful Tissue Culture CHAMBER/SLIDES are for ANA and other FA techniques but if by chance you've adapted our CHAMBER/SLIDE to some other useful technique, please let us know.

Lab-Tek Tissue Culture CHAMBER/SLIDES, #4808 (8-chamber), are available from your Lab-Tek Products Service-Certified Distributor.

Lab-Tek Products, setting the standards by which performance is judged.

simplifies immunoelectrophoresis

This complete little package contains almost everything you need except the specimen and some equipment. The gammopathy kit contains 10 rehydratable films, 4 different antisera, buffer, tracking dye, supports, blotting and wick paper.

The MCI-IEP rehydratable film* (highly purified agarose bonded to a plastic sheet) eliminates the cumbersome task of pouring and punching IEP slides, and can also be used as a permanent record, thus reducing the costs of photographs.

The Behring antisera assist you in detecting IgG, IgA and IgM monoclonal gammopathies. Bence Jones proteins can be detected by their reaction with Anti-lgG serum specific for H and L chains.

Behring antisera and the rehydratable film can be purchased separately.

BD831

*Manufactured for Behring Diagnostics by MCI Biomedical Division of Marine Colloids Inc.

The Variation and Adaptive Expression of Antibodies

George P. Smith

George P. Smith presents a new and simplifying approach to the origin of the diversity of antibodies. The author traces the evolution of antibodies by computer analysis of their amino acid sequences and matches his results against the expectations of the various theories of diversity. He also deals with the clonal specialization of cells to produce a single antibody and the somatic joining of antibody half-genes.

USE YOUR ZIP CODE

Remember, your zip code provides faster, more direct delivery of your journals. Use it on all correspondence, too.
If you talk about immunochemicals—
we will understand you!

We speak English, French, Chinese, Hebrew and
Swahili, but mostly we speak immunochemicals, and
that is the language we speak best.

Does it seem strange that our goats graze the hills
leading to Jerusalem and yet if we don’t leave the rab-
bit houses before 4:30 p.m., we get caught in the five
o’clock rush back to the lab in Kankakee? Strange,
perhaps, but our animals are certainly productive!
Jointly, Miles-Yeda, Rehovot, Israel, and Miles Re-
search Division, Kankakee, Illinois, produce over 150
different antisera, immunodiffusion plates, immuno-
chemical kits and immunoabsorbents.

We find our international environment stimulating,
too. Our involvement with the Weizmann Institute of
Science (we are right on the campus) plus the tech-
nological advances made at our Kankakee labs provide
insight and background to produce the products you
need.

We invite your questions, comments or suggestions.
Again, we don’t care what the accent is—if you speak
Immunochemicals, we will understand you.

INDUBIOSE POWDER
(AGAROSE)

NEUTRAL GEL-FORMING POLYSACCHARIDE EXTRACTED FROM GELOSE

Devoid of polar groups, Indubiose gels offer all the advantages of agar gels with none of their drawbacks. The inert character of Indubiose eliminates any danger of interference with chemical and biological substances. In microbiology, Indubiose permits and often considerably enhances the growth of a great number of bacteria and viruses. Indubiose is also a supporting medium of choice for immunological gel diffusion techniques as well as for electrophoretic separation procedures.

THREE GRADES AVAILABLE:
- INDUBIOSE A 37 = gelling point at 37°C
- INDUBIOSE A 45 = gelling point at 45°C
- INDUBIOSE HAA SPECIAL for Australia antigen research.

APPLICATIONS:
- FOR ELECTROPHORESIS AND IMMUNOLOGY: Indubiose A 37.
- FOR BACTERIOLOGY AND VIROLOGY: Indubiose A 45.
- FOR AUSTRALIA ANTIGEN RESEARCH: Indubiose HAA Special.

INDUBIOSE PLATES
FOR ELECTROPHORESIS

Gel of acrylamide-agarose in the form of dehydrated plates of 10 x 20 cm having the appearance of a flexible and transparent rectangular film.

ADVANTAGES OF THE DEHYDRATED PLATES:
- Simplicity of use; regularity of preparations; unlimited shelf-life.
- Not only a supporting medium but also a true molecular sieve; rapid migration; high transparency; absence of diffusion phenomena; conservable electrophoregrams.

APPLICATIONS:
- Separation of protein substances of molecular weight ranging from 6,000 to 1,000,000 such as enzymes, serum proteins and protein hormones.

SUPPLY:
Indubiose plates for electrophoresis are supplied in packages of 10 (sufficient for 30 to 40 electrophoretic analyses).

meets your exact requirements in quality bred guinea pigs
6 hours*...48 hours...or even longer, Behring's End-Point determinations will consistently be right on1...

With Behring Diagnostics' end-point system you may be assured of obtaining the most accurate and reproducible radial immunodiffusion measurement available. Based on the technique of Mancini, Carbonara and Heremans1, protein antigens diffuse to end-point and no further. Neither do they stop short of accuracy.

Furthermore, precipitin rings can be read at your convenience. At 6 hours an early read-out may be obtained for such determinations as IgG and IgA.*

Once end-point is reached, controls remain stable for a weekend, a week, and, with Tri-Partigen, even a month.

With accuracy and stability such as this, economy and convenience can be yours. As a time and money saver, full-plate usability does not require that all wells be filled at once.

For end-point protein quantitation, 28 different plates are available. This is the widest selection you
will find and it offers 10 determinations for which Behring Diagnostics is the only commercial source.

Air-tight, "climate-controlled" packaging of these color-coded plates helps to preserve the integrity of the antibodies and the agarose.

28 DIFFERENT PLATES—each the first of its kind—each a part of the only totally end-point radial immunodiffusion system.

Tri-Partigen™—IgG, IgA, IgM
M-Partigen™—Prealbumin, α1 Acid Glycoprotein, Gc Globulin, α2 HS Glycoprotein, Haptoglobin, α2 Macroglobulin, Hemopexin, C3c (β1/2/3, C Globulin), β2 Glycoprotein 1, α1 Antitrypsin, Transferrin, Antithrombin III, Ceruloplasmin, Plasminogen, Fibrinogen, Albumin, C4 (β1/2/3, C Globulin), β Lipoprotein.
S-Partigen™—IgA, IgM
LC-Partigen™—IgG, IgA, IgM, IgD, CRP

Total system RIA where chemistry comes first... for total answers

Micromedic Systems has successfully adapted the majority of available RIA reagents to instrumentation. Now, in another major step, we offer:

**RIA reagent kits**

of exacting standards, developed by a leading university research center. All kits are $^{125}$I-labelled, double antibody, utilizing a standard buffer from assay to assay. Protocols are matched to the system's performance and standards of the instruments below.

**Automated pipetting station,** allied to the RIA rack, assures hands off RIA all through the system... no individual tube handling, no massive micropipetting, no deviations in volume and dilution. Flexible through-put: handles small or large numbers of tubes with equal ease, all with reproducibility of 0.5% C.V. or better.

The RIA rack... heart of hands off, precise-reaction, total system RIA offered only by Micromedic Systems... samples prepared, incubated, centrifuged and counted, all in the same rack, all without handling or misnumbering.

See us at Booths 107, 109, and 111 at the A.S.C.P.
Incubation and separation. Incubation in air or water is achieved, again without tube-handling: samples remain securely in place in RIA rack.

Centrifugation is speeded as well: rack fits popular refrigerated centrifuge heads. Centrifuged samples decanted directly from the rack with exclusive decanting clamp.

Automatic gamma counting system uses standard RIA racks, completes error-free sequence of hands off RIA. The equivalent of three separate counting systems: each of 3 assay lots can be independently programmed, even for isotope selection. This economical time-sharing means multi-user access, permits sharing of capital cost.

Automatic mode may be interrupted for manual counting with no loss of index... greater assurance for your stats.

Data reduction is straightforward: gamma counts are presented in standard Teletype™ form, adaptable through standard ASCII punched tape to any offline computer, such as the lab processor or central institutional processor. Rely on Micromedic Systems’ extensive experience: let us recommend the data reduction process best suited to your individual needs.

This total system RIA family can deliver the greatest RIA precision and reproducibility available. Write us for full details.
