DESCRIPTION

Anti-theta serum (anti-θ serum) is produced in AKR mice immunized with thymocytes from young C₃H mice. Since these mouse strains are syngeneic at the H-2 locus, this procedure raises antibodies against the allogeneic C₃H theta antigen specifically associated with thymus derived lymphocytes (T-cells).

CHARACTERIZATION

Each lot of anti-theta serum is precisely characterized the following ways:

- Specific cytolytic activity against
  - C₃H Thymocytes
  - C₃H Spleenocytes
  - AKR Thymocytes
  - C₃H Bone Marrow Cells
- Specific absorption reactions with
  - C₃H Brain Cells
  - AKR Brain Cells
  - C₃H Kidney Cells
- Effect on mitogenic response to
  - Phytohemaglutinin
  - Lipopolysaccharide

Until Cordis developed its Complement Component Test Sets, it just wasn't possible for most laboratories to measure the functional activity of complement components. Technologists had to cope with difficult and complicated on-site preparation of components or use radial immunodiffusion tests, which measure only the presence of complement components and not the activity.

Now Cordis Complement Component Test Sets make it practical to perform assays for all 9 components in your own laboratory. These sets offer everything you need for accurate, functional analysis by hemolytic assay. All elements are standardized for optimum specificity and sensitivity.

Cordis Complement Component Test Sets include component reagents, stable cellular intermediates, buffers and complete, easy-to-follow instructions. Cordis also offers all laboratory equipment and supplies required for complement assay work. For more information on the Cordis Complement Component Test Sets, fill out and mail the coupon or call our toll-free "800" number.

You can send specimens to the Cordis Complement Reference Service for analysis by our highly-trained staff. We can assay for whole complement, for any or all complement components and for 2 complement component inactivators. Assays are performed either in tubes or microtiter plates as you specify. Results are airmailed to you (telephoned on request) within 3 working days after we receive the specimen. We supply a postage-paid insulated mailing carton, specimen vials, report forms and instructions.

Fill out and mail the coupon—or call our toll-free "800" number—for complete information on the Cordis Complement Reference Service, Complement Component Test Sets, supplies or equipment.
New Phadebas® IgE Test
makes IgE testing simpler, faster and more convenient than ever before possible

Radioimmunoassay
based on the solid phase Sephadex® principle
Complete reagents
sufficient for 50 determinations
Fast results
overnight incubation at room temperature
Wide range
measures serum levels 10 to 4000 U/ml

Pharmacia Laboratories Inc.
800 Centennial Avenue. Piscataway, New Jersey 08854

Please send me further information on the following Phadebas tests

□ B₁₂ □ IgE □ Insulin □ Amylase

THERE ARE
TWO WAYS TO LOOK AT R.I.D.
IMMUNO-PLATE® III TESTS GIVE YOU BOTH
IN ONE PLATE.

End-point or measured-time. Now there’s
a one-plate radial immunodiffusion system that lets you run both.

Three different reading times, too. 48-hour
precision. 16-18 hour overnight. Even 4-hour stat.

Two different technics plus three-speed flexibility
makes a big difference in testing convenience. Now you can use
a single test system that does the job of two. Plus you get 4-hour test
capability for stat orders or screening purposes.

And to make it even easier, our new test system
lets you forget time-consuming serum dilutions. For major tests
within normal adult working ranges, they’re simply not required.

The Immuno-Plate III immunodiffusion system
is offered in a broad range of serum protein tests. All with two-technic,
three-speed adaptability. All in a convenient six-well plate
that reduces waste.

No matter how good you think your present test
is, you’ll have to agree ours is one better. Maybe two.

Talk to your Hyland representative for all the details.

Directions for use are provided in each package.
These directions should be read and understood
before using. Particular attention should be paid to
all warnings and precautions. Should you have any
questions, call your Hyland representative or call
toll-free (800) 854-3235. In Alaska, California,
Canada and Hawaii call (714) 540-5000.
Before you renew your contract for
REAGENTS for
AUTOMATED PROCEDURES
consider Sigma

Sigma offers one of the most complete selections of reagents for AutoAnalyzers®, SMA® and AA II® systems.

Quality is excellent — Service is unexcelled.

As a basic manufacturer of NAD, Diaphorase, Phosphocreatine, p-Nitrophenyl Phosphate, Malic Dehydrogenase, Lactic Dehydrogenase and many more of the most important enzymes and substrates needed in the formulation of reagents for automated procedures, Sigma is in a unique position to guarantee complete satisfaction.

For complete descriptions, request our special catalog of clinical reagents. If you need any reagent we do not list, please call for current status — we are continually expanding our offerings.

ALL SIGMA REAGENTS ARE UNCONDITIONALLY GUARANTEED

Also available:

REFERENCE SERUM FOR SMA PROCEDURES
One set consists of 50 ml. (dried) Reference Serum and sufficient Diluent for reconstitution.
Product No. R 3626

CONTROL SERUM (Unassayed)
One set consists of 10 ml. (dried) Control Serum and sufficient Diluent for reconstitution.
Product No. C 0262
Product No. C 0387
(normal to borderline) (borderline to elevated)

Reference and Control Serums contain:
Sodium, Potassium, Chloride, CO₂, Calcium, Inorganic Phosphate, Glucose, Urea Nitrogen, Uric Acid, Cholesterol, Total Protein, Albumin, Total Bilirubin, Alkaline Phosphatase, LDH, SGOT, and Creatinine.

Other manufacturers of Automated Reagents as well as laboratories that prepare reagents for their own use might profit by calling Lou Berger or Dan Broida at Sigma.

The main point is that our unique design makes the Bio/Physics Cytograf and Cytofluorograf clog-resistant and self-cleaning. Unlike conventional counters, our instruments have no "sticking point" in their cell flow systems. Consequently, there is no longer any need to sacrifice resolution to prevent clogging.

Each cell sample enters the flow chamber through the center of a laminar sheath of water. The water surrounds the sample and contains it without mixing. As the stream-within-a-stream passes through the flow chamber, the (outer) water constricts the (inner) sample, narrowing it to just 30μ and accelerating its flow. Thus, the cells pass single-file through the 20μ thickness of a focused laser beam, at a rate of about 150,000 cells per minute.

Whether you're taking a routine cell count or performing an exacting analysis such as DNA per cell distribution, Bio/Physics instruments offer you high resolution, without aggravating interruptions of flow.

There are many other advantages we could point out about our counters. But we'd rather let you discover them. By seeing one of our instruments in action, and getting more information. Send today for our helpful guide to counting, sizing, differentiating, characterizing and measuring cell constituents. Bio/Physics Systems, Inc., Baldwin Place Road, Mahopac, New York 10541. (914) 628-7451.
Now—Any laboratory can deliver results within hours

Introducing . . . a specific test for human erythropoietin (ESF) which provides definitive results 50 TIMES FASTER than bioassay methods. JCL Clinical Research Corporation has developed a fast, simple immunochemical test, utilizing the principle of hemagglutination-inhibition (HAI), which has made it possible to assay erythropoietin levels in almost all clinical laboratories. The usefulness of ESF quantitation has previously been limited by the cumbersome, time consuming and expensive bioassay methods available for carrying out such determinations. On the other hand, the new HAI test for human erythropoietin is relatively simple, can be performed in a short period of time, is reproducible, economical and sufficiently sensitive to detect extremely small differences.

The level of plasma or serum erythropoietin offers a reliable means of classifying diseases of the red blood cell.

This new JCL Erythropoietin Test Kit is available from Scientific Products, Division of American Hospital Supply Corporation.

Rhodamine Conjugated Anti-Human IgA
Rhodamine Conjugated Anti-Human IgG
Rhodamine Conjugated Anti-Human IgM
Rhodamine Conjugated Anti-Human Immunoglobulins (IgA+IgG+IgM)
Rhodamine Conjugated Anti-Human IgE
Rhodamine Conjugated Anti-Human Albumin
Rhodamine Conjugated Anti-Human Complement C3

For versatility use as the first antibody any specific Cappel antiserum. Then use one of the following Rhodamine Conjugates for the indirect test:

Rhodamine Conjugated Anti-Goat Gamma Globulin
Rhodamine Conjugated Anti-Rabbit Gamma Globulin
Rhodamine Conjugated Anti-Sheep Gamma Globulin

MANY OTHER RHODAMINE CONJUGATES ARE AVAILABLE
Specialists in Fluorescein, Rhodamine, Ferritin and Peroxidase Conjugations.

PURE LECTINS

Cell surface studies
Lymphocyte stimulation
Chromosome analysis

Leucoagglutinin
Unlike crude preparations of PHA, Leucoagglutinin is an electrophoretically pure glycoprotein with potent lymphocyte stimulating activity but no erythroagglutinating activity.

ConA
Prepared by affinity chromatography on Sephadex. Fully active and no further purification is required. Freeze-dried powder containing at least 99% protein and less than 0.1% carbohydrate.

15-Second Prints
Cordis
Immuno-Diffusion Camera

Ideal for photographing in-progress or final results of 1 and 2 dimensional IDF, immuno- and membrane disc electrophoresis, hemagglutination, pregnancy tests, blood typing, bacterial sensitivities and counts. Yields clear, sharp Polaroid prints of wet, dry, stained or unstained translucent materials. Faint or closely-spaced precipitin lines are easy to see and interpret because you can select light- or dark-field illumination at 1.9 or .9 magnification. Supplied with light diffuser, film, positioning adapters for slides and plates. Write or call for technical literature, demonstration in your laboratory.

With Behring Diagnostics' end point system you may be assured of obtaining the most accurate and reproducible radial immunodiffusion measurement available. Based on the technique of Mancini, Carbonara and Heremans¹, Protein antigens diffuse to end point and no further. Neither do they stop short of accuracy.

Furthermore, precipitin rings can be read at your convenience. At 6 hours an early readout may be obtained for such determinations as IgG and IgA.

Once end point is reached precipitin rings remain stable indefinitely under proper storage.

With accuracy and stability such as this, economy and convenience can be yours. As a time and money saver, full-plate usability does not require that all wells be filled at once.

For end point protein quantitation, 30 different plates are available. This is the widest selection you will find and it offers determinations for which Behring Diagnostics is the only commercial source.

Tri-Partigen* - IgG, IgA, IgM
M-Partigen* - Prealbumin, α, Acid Glycoprotein, Gc Globulin, α₂ HS Glycoprotein, Haptoglobin, α₂ Macroglobulin, Hemopexin, C3c (β₃,β₃,β₃,β₃,β₃ Globulin), β₂ Glycoprotein I, α₁, Antithrypsin, Transferrin, Antithrombin III, Ceruloplasmin, Plasminogen, Fibrinogen, Albumin, C4 (β₁,β₁,β₁ Globulin), β Lipoprotein, C3-Activator.
S-Partigen* - IgA, IgM
LC-Partigen* - IgG, IgA, IgM, IgD, CRP and IgE

It's the best because it best defines the medicine that you practice.

The new edition contains:
• 7,199 significant new vocabulary entries
• 24,877 important editorial revisions
• excellent color plates and illustrations
• an alphabetical index to subentries
• appendices, tables, eponyms, and synonyms
• a special section to help you get the most from your dictionary

Beautifully bound and thumb-indexed for easy use, the new Stedman's will be the most valuable addition to your library in years.
