Antisera to Mouse Immunoglobulins

Heavy chain specific antisera (rabbit anti-mouse) are available for the following mouse immunoglobulins:

- \( \gamma A \) (IgA)
- \( \gamma G1 \) (IgF)
- \( \gamma G2a \) (IgG)
- \( \gamma G2b \) (IgH)
- \( \gamma G3 \) (IgI)
- \( \gamma M \) (IgM)

Immunization was conducted with highly purified antigens as evaluated by polyacrylamide gel disc electrophoresis for biophysical homogeneity and immunoprecipitin analysis for antigenic purity.

The antisera are rendered monospecific by solid phase immunoadsorption to yield products free of soluble immune complexes and unwanted immunoadsorbents.

The action of Bio/Physics' instruments ranges from routine blood cell counting to sophisticated, extremely fast flow-through scatter/fluorescent cytophotometry involving the most complex staining reactions on heterogeneous cell populations.

For example, counting immunofluorescent cells. The study of immunological reactions, such as counting T and B lymphocytes, is a significant area in cancer research today. Or monitoring the therapy of leukemic patients, cytophotographically. Or a study of DNA distribution in rat liver cells that distinguishes cells with diploid, tetraploid and octaploid DNA content. But you'll have to determine for yourself how the Cytograf and Cytofluorograf can work for you. The best way is to see our instruments in action. We'll give you a demonstration of our counters' capabilities—on the cell populations you're concerned with—at your convenience.

Act now. Call or write: Bio/Physics Systems, Inc., Baldwin Place Road, Mahopac, New York 10541 (914) 628-7451.

Sometimes, cell raising can be hard sledding.

When you raise cells, you know there's always a chance that trouble is waiting around the bend. But when you're working with Flow Laboratories, we can help keep you on the right track. We do what you do, so we know how to give you exactly what you need. For cells, media, sera and cell-raising equipment, rely on us. We're the Cell Raisers.

You can depend on us. Because we're Cell Raisers, just like you.
Gel filtration and
Affinity chromatography even
in 6M GuHCl, organic solvents, 8M urea,
3M KSCN
at pH3, pH12, 80°C

CROSS-LINKED SEPHAROSE is a new beaded agarose chromatographic
medium with exceptional stability and extremely low non-specific adsorption.
It can be used with confidence in the most extreme dissociating media including
strong solutions of urea, guanidine hydrochloride and chaotropic salts.
Sepharose CL can also be used in organic solvents.

You can sterilize Sepharose CL repeatedly by autoclaving at 110°C - 120°C.
Cross-linked Sepharose is available in three types:
Sepharose® CL-2B, CL-4B and CL-6B.

Ask for the free booklet with data and details of new techniques, from your
supplier of Sephadex®, Sepharose® and other separation media.
Delayed Hypersensitivity
Second Revised Edition
by J.L. TURK, Sir William Collins Professor of Human and Comparative Pathology, Royal College of Surgeons of England, and Institute of Basic Medical Sciences, University of London.

FRONTIERS OF BIOLOGY, Vol. 4*

This revised edition of Delayed Hypersensitivity has been made necessary by rapid advances in the field over the past 8 years. Since the publication of the first edition, delayed hypersensitivity and cell-mediated immunity have become one of the more popular fields of research in immunology. New knowledge has become available particularly in the area of pharmacological mediators involved in the interaction between different classes of lymphocytes. This new information has been incorporated into this volume which aims at providing those in other fields of immunology with a working knowledge of delayed hypersensitivity so that they may be able to recognize where it impinges on their own subject.

**DEPENDABLE LOW COLD CABINETS**

You can depend on Scientemp Low Temperature ranges from zero to $-140^\circ$F ($-96^\circ$C). Our warranty reflects our commitment to quality engineering and manufacturing.

Available in 16 standard or custom models, Scientemp cabinets are designed to meet laboratory, hospital, university, or industrial needs. Constructed with long-term functional, mechanical, and safety features inside and out, Scientemp cabinets withstand day-to-day demands of research, testing, storage, or processing.

**STORAGE CAPSULES**

You get the most convenient way to organize specimens and the most efficient way to utilize the capacity of your cabinet with Scientemp capsules and accessories. Scientemp capsules are lightweight, easy to clean and use, multi-purpose storage units designed for use in the laboratory and in low temperature cabinets. A choice of shelves, trays, and racks customizes units to suit your particular needs.

Sets or separate parts are available.

**ADVERTISEMENTS OF SERUM PANELS**

A variety of antigenic serum components have been reported to be uniquely present, or present in elevated or decreased quantities, in the sera of cancer patients, as compared to other patients or to normal individuals (e.g., peptide hormones, virus antigens, $\beta_2$ microglobulin). The National Cancer Institute is interested in evaluating assays that have potential for the immunodiagnosis of cancer. Coded serum panels are available to evaluate assays which have given preliminary indications of discrimination between cancer patients and controls. Promising results on this coded panel may provide the basis for contract support in development of the immunoassay. Preliminary data documenting a useful test and request for a coded serum panel to evaluate it should be sent to: Immunodiagnosis Serum Panels, Building 8, Room 118, National Cancer Institute, National Institutes of Health, Bethesda, Maryland 20014.

**INVOLVED IN THE COLLECTION, HARVESTING, PROCESSING OR SEPARATION OF CELLS ???**

THE MODEL CHAP-100, CELL HARVESTER AND PROCESSOR, PROVIDES A RELIABLE, EFFICIENT, AUTOMATED SYSTEM FOR THE COLLECTION (HARVESTING) AND PROCESSING OF CELLS AND THEIR SUPERNATANTS (FILTRATES) FOR THE LABORATORIES FOR IMMUNOLOGY, TISSUE TYING, CELL CULTURES AND VIROLOGY.

- Easy to operate and maintain.
- Flow control for washing solutions.
- More accurate and reproducible results.
- Interchangeable collection heads for harvesting from microtiter plates or test tube racks.
- Rugged stainless steel design for protection against corrosive and radioactive elements.
- Field proven for varied laboratory applications.
- Requires no electrical power-only a simple vacuum.
- Test tube rack for individual filtrate collection.

Antibody of any sort is usually sold by volume, in milliliters, with some vague statement of antibody content—usually a dilution at which the product supposedly remains useful. We can now directly quantitate the actual antibody content of a given batch of second antibody, since second antibody precipitates as well as binds antigen. The method in use at Calbiochem is illustrated below with actual data on a lot of Goat Antibody to Rabbit Gamma Globulin (GARGG). Antigen, in this case rabbit gamma globulin, is iodinated to high specific activity using the elegant and non-destructive method of Bolton and Hunter [Biochem. J., 133; 529 (1973)]. After purification on Sephadex®, the labeled rabbit gamma globulin is diluted to a stock solution containing 1 mg/ml in phosphate buffer, pH 7.4, at a label level of 200,000 counts/mg. 10,000 counts, equivalent to 50 μg of rabbit gamma globulin, are added to a series of tubes containing levels of raw antiserum increasing from 0 to 50 microliters. Buffer is added to a final volume of 1.0 ml in each tube. Precipitation is complete in 4 to 8 hours (see Fig. 2), but incubation is continued overnight. The tubes are spun and the radioactivity is measured in the supernatant as well as in the precipitate. A plot of the percentage of counts bound in the precipitate against antiserum volume/tube permits calculation of the exact amount of antibody needed to maximally precipitate a given weight of rabbit gamma globulin. As defined by Calbiochem, one unit of GARGG will maximally precipitate 40 micrograms of labeled rabbit gamma globulin under the above conditions. In practice, one unit is also that amount of GARGG needed to run one "tube" during any Calbiochem protocol requiring second antibody.

Order GARGG, CAT. NO. 539844, $6.00/5 ml; $24.00/5 x 5 ml. (Each 5 ml vial is lyophilized and contains 125 units); or CAT. NO. 539845, $300.00/10,000 units; $1350.00/5 x 10,000 units. The 10,000 unit size is supplied as a frozen serum.
Anatomy of the Guinea Pig

Gale Cooper, M.D., and Alan L. Schiller, M.D.

This first complete and accurate anatomy of the guinea pig sets a new standard of beauty and clarity in anatomical illustration. A detailed, thorough, and practical guide to the morphology of the animal is provided in a text illustrated with about four hundred drawings. Nomenclature has been standardized according to the Nomina Anatomica Veterinaria and the dissections correlated with the published literature on guinea pig anatomy. Commonwealth Fund $40.00

ACTIVITY: Approx. 8 U/mg Protein (W/C)

Suitable for assay of Dihydrofolic Acid per Matthews and Heunnekens, JBC 238:3436, (1963)

UNIT DEFINITION: One unit will convert 1.0 μMole of 7, 8-Dihydrofolate and NADPH to 5, 6, 7, 8-Tetrahydrofolate and NADP per minute at pH 8.5 at 25°C.

We also offer...

5, 10-METHYLENE TETRAHYDROFOLATE DEHYDROGENASE
(5, 10-Methylenetetrahydrofolate: NADP oxidoreductase; E.C. No. 1.5.1.5)

ACTIVITY: 0.2 to 0.5 U/mg.

Suitable for the Determination of Formimino-L-Glutamic Acid (FIGLU) in Urine or other Fluids, per Sigma Technical Bulletin No. 365.

UNIT DEFINITION: One unit will convert 1.0 μMole of FIGLU and THF to 5, 10-Methyl-THF per minute at pH 7.2 at 25°C.

FORMIMINO-L-GLUTAMIC ACID (FIGLU)

No. F 8626 – Hemi-Barium Salt
Contains 2.0 μMoles FIGLU per ml.
