Alicia Ballester, Rafael To-beña, Carlos Lisboa, Victor Calvo, and Susana Alemany

On the cover: Graphical representations of MHC class I molecules H-2Db and HLA-A2.1. Identical residues are shown in green. A murine CTL clone (AHI112.2) displays peptide-specific recognition of both of these molecules, and cytolytic assays suggest that these are functionally equivalent epitopes. This TCR appears to make a different, but overlapping set, of contacts with each class I/peptide complex. In this instance, cross-recognition appears to be the result of both shared and complex-specific contacts. (Figure 8 from Loftus, D. J., Y. Chen, D. G. Covell, V. H. Engelhard, and E. Appella. 1997. Differential contact of disparate class I/peptide complexes as the basis for epitope cross-recognition by a single T cell receptor. J. Immunol. 158:3651.)
