phosphoELISA™ Assays

Uncover apoptosis: a sensitive and sensible approach

Invitrogen BioSource™ phosphoELISA™ assays for studying apoptosis

Apoptosis, or programmed cell death, is essential to the development, immunological competence, and homeostasis of living things. It has become one of the most widely researched cell processes in biology, with over 1,200 articles published monthly in the past year alone.

Induction of apoptosis unfolds a cascade of events that triggers the activation of effector caspase proteases. Caspase proteases then cleave poly (ADP-ribose) polymerase (PARP), a 116 kDa nuclear protein typically involved in DNA damage detection and repair, between Asp214 and Gly215. This cleavage produces the p85 and p25 fragments, effectively eliminating DNA repair by PARP during apoptosis and committing the cell to the apoptotic pathway (Figure 1).

Many assays designed for examining apoptosis rely upon the activation of caspases. However, caspase proteases are rapidly degraded, making them difficult to detect and often overlooked by existing methods. Fortunately, there are other targets available for measuring apoptotic activity. Since PARP cleavage plays a significant role in apoptosis, PARP, p25, and p85 are ideal markers for these assays.

Invitrogen’s Cleaved PARP [214/215] phosphoELISA™ Kit is designed to detect and quantify ultrasensitive levels of the human PARP p85 fragment. Conveniently packaged as a ready-to-use kit, it provides sensitive quantitative results in only four hours. In fact, the Cleaved PARP [214/215] phosphoELISA™ Kit can detect apoptosis in as few as 50–100 cells, making it 100x more sensitive than caspase-3 protease assays (Figure 2) and 10x more sensitive than western blot detection (Figure 3).

Now you can decisively uncover apoptotic activity in your experiment with the Cleaved PARP [214/215] phosphoELISA™ Kit. To learn more and find additional apoptosis-related products, visit www.invitrogen.com/biosource. Your search for apoptosis solutions is over.

Figure 1—Pathway of PARP cleavage by caspases.

Figure 2—Sensitivity comparison of the Cleaved PARP [214/215] phosphoELISA™ Kit to a caspase-3 protease assay. Jurkat cells were treated with 1 µM staurosporine for 3 hours. Cell extracts were prepared. Cell lysates were serially diluted and analyzed with the Cleaved PARP [214/215] phosphoELISA™ Kit (Cat. no. KHO0741) and Caspase-3 Colorimetric Kit (Cat. no. KH00741) and Caspase-3 Colorimetric Kit (Cat. no. KH00741). The amount of cell lysate assayed was plotted against the corresponding O.D. signal.

Figure 3—Detection of cleaved PARP [214/215] by ELISA and western blot. Jurkat cells were treated with staurosporine. The amounts of cell lysate used in western blotting and ELISA are indicated. Different amounts of cell lysate were used due to the much higher sensitivity of ELISA. The bands shown in the western blotting data were developed using rabbit anti-cleaved PARP [214/215] (Cat. no. 44-698G) and an alkaline phosphatase-conjugated anti-rabbit IgG followed by chemiluminescent substrate and autoradiography.
R&D Systems offers these Array Kits:

- Human Cytokine Array Kit, Panel A
- Human Phospho-Immunoreceptor Array Kit
- Human Phospho-Mitogen-Activated Protein Kinase (MAPK) Array Kit
- Human Phospho-Receptor Tyrosine Kinase (RTK) Array Kit

Proteome Profiler™ Arrays simultaneously detect multiple proteins in a single sample.

Proteome Profiler Arrays enable the measurement of the relative levels of phosphorylation or abundance of multiple proteins in a single serum, plasma, or cell culture supernatant sample. Proteome Profiler kits contain buffers, detection antibodies, and membranes spotted in duplicate with capture antibodies carefully selected for their specificity. And with chemiluminescent detection, no specialized equipment is necessary.

Sample data for R&D Systems Human Cytokine Array, Panel A demonstrating high-throughput multi-analyte profiling of 36 cytokines, chemokines, and acute phase proteins in a single sample of PBMC supernatant.

For research use only. Not for use in diagnostic procedures.
Introducing MoFlo™ XDP.

Accelerate your cell sorting research. The power of MoFlo XDP provides zero dead time, automated droplet stream control, and the most advanced software platform and application capabilities on earth. Discover what you can achieve. Go to extremes. Go to Dako. www.dako.com/MoFloXDP

Let’s connect.
Unparalleled Antibody Quality

...from Cell Signaling Technology

Translates into reproducible results in all tested applications.

As scientists we understand your needs – our entire focus is your experimental success. The combination of our experienced PhD level development scientists overseeing antibody development together with novel antibody production technologies results in the highest possible product quality. All product development and production follows rigorous in-house testing on a wide range of assay applications. Moreover, technical support is provided by the same scientists who produce the antibodies and know them best. Because of this, Cell Signaling Technology’s phospho-antibodies are cited more than all other competing products combined.

Unparalleled product quality, validation and technical support

- Our commitment to quality means reproducible results in all tested applications.
- Our antibodies are optimized in a wide range of assay applications by our in-house clinical applications group – optimization is not left up to you, the user.
- In-house product development and production means technical support by the same scientists who develop the antibodies and know them best – this translates into a thorough, fast and accurate response.
- Our total protein antibodies meet the same quality standards as our activation-state antibodies – purchasing both from Cell Signaling Technology ensures product quality, support and validation.

for quality products you can trust...

In flow cytometry, every dot tells a story . . .

The ImageStream® system

For over 30 years, flow cytometry has been about the dots. But behind every dot is a cell, rich in morphological complexity. Now, the ImageStream imaging flow cytometer from Amnis makes this wealth of biological information directly accessible. By combining quantitative microscopy and the statistical power of flow cytometry in a single platform, the ImageStream offers you completely new options for cell analysis.

Study the intracellular distribution of markers, analyze interactions between cells, quantitate subtle morphologic changes in the cell and its structures, and much more. The range of applications is extensive, as is the growing list of published science.

While we can’t guarantee that every experiment you do with the ImageStream system will turn into a publication, we do guarantee that when you analyze your cells on the ImageStream you will see more -- and know more -- than you ever thought possible.

To learn more, visit www.amnis.com or call 800-730-7147 toll-free in the US or +1 206-374-7000 outside the US.

ImageStream. Think outside the dot.
INNOVATION @ WORK

Amazing!

Over 4,000 high quality antibodies from a single source

Sigma’s AMAZING collection of high quality antibodies:

- Includes monoclonals, polyclonals, secondaries, conjugates and custom services
- Validated using a variety of methods – WB, IHC, IF, IP, ELISA
- Easily explored through Sigma’s award-winning online tools
- Supported by Sigma’s world-renowned technical service to assist you with your specific antibody requirements

Sigma is your source.
Go to sigma.com/antibody and be Amazed!
Powerful tools to elucidate the beast!

Order our new Cell Analysis Catalog.

Who says you can’t have it all? We’ve bridged the gap with reagents for clinical and research use with human and non-human antigens. And we’ve expanded our selection with new reagent lines for signal transduction, bead-based multiplexing and immunotoxicology. Whether you need powerful, automated instruments or hundreds of reliable reagents, you’ll discover all the cellular analysis solutions you need, all in one place: our 2007/2008 catalog. See how Beckman Coulter meets your broadest expectations at www.beckmancoulter.com/cellcatalog
You can now obtain viable Treg cells with a novel 3-color surface staining approach.

- No cellular permeabilization necessary
- Isolate viable cells for further experiments
- Increase recovery of CD25\textsuperscript{int/hi} Treg cells
- Eliminate contaminating CD25\textsuperscript{-/int} T-effector cells
