On the cover: Fluorescence microscopy image demonstrating that, following phagocytosis of (green) silica particles, human monocytes are largely prevented from incorporating into RANKL-induced monocyte-derived multinucleated osteoclasts, identified by phalloidin (red) and DAPI (blue) staining. James, D. E., B. J. Nestor, T. P. Sculco, L. B. Ivashkiv, F. P. Ross, S. R. Goldring, and P. E. Purdue. 2010. The relative timing of exposure to phagocytosable particulates and to osteoclastogenic cytokines is critically important in the determination of myeloid cell fate. *J. Immunol.* 185: 1265–1273.
