On the cover: Section of a spleen from a compound knockout mouse lacking expression of both EBI2 and CXCR5. The central location of T cells (blue) in the white pulp remains unaffected, but follicular (green) and marginal zone (red) B cells no longer segregate and are intermingled. Gatto, D., K. Wood, and R. Brink. 2011. EBI2 operates independently of but in cooperation with CXCR5 and CCR7 to direct B cell migration and organization in follicles and the germinal center. *J. Immunol.* 187: 4621–4628.
