On the cover: Overexpression of RIG-I fails to suppress HBV replication in Huh7 cells. Huh7 cells were cotransfected with RIG-I expression plasmid and the HBV replicative plasmid. The confocal microscopic image shows that cells with RIG-I expression (red) are also positive for HBV core Ag (green), indicating that RIG-I signaling fails to suppress HBV replication.

Get a GRIP: An AAI program designed to help new investigators prepare their NIH grant proposals

AAI is pleased to offer a program to match new PIs with established PIs who have significant, successful grant writing careers. The Grant Review for Immunologists Program (GRIP) invites new PIs to submit an outline or NIH-style abstract to the GRIP coordinator who, with the assistance of a small volunteer subcommittee, will attempt to match the topic of the proposal with the research experience of an established PI. Matches will be made as quickly as possible to allow new PIs to meet upcoming NIH grant deadlines. Participation is open only to AAI members and is strictly voluntary. The program is not intended to supplant internal mentoring programs.

GRIP is now accepting both new PI and established PI participants. Please send your CV and a brief description of either your potential research project (new PIs) or grant reviewing experience (established PIs) to infoaai@aaai.org (please write “GRIP” in the subject line).
