Here's Something New

FANTASCIENCE

Announcement—This Company has a reputation (earned, we hope) for publishing books only of the most sober and upright character. We have worshipped at the shrine of the great god Authenticity. Fiction has been beneath our snooty notice.

We now unbend. We announce our first book of fiction. But observe, this is no ordinary book of fiction. It is fantascience—i.e. while it is fiction in good earnest, to be read solely for the fun to be derived from it, written not to inform, or to instruct, or to strike dead in debate, but for the romance of the thing, nevertheless the romance is not mere flight of fancy. If the future is prognosticated, it is a future with seedlings in the present; the author has not gone beyond the bounds of present knowledge. Fantascience is written by and specifically for scientists.

Before the Dawn

By JOHN TAINÉ (Eric Temple Bell, Professor of Mathematics, California Institute of Technology)

YOUNG Langtry, engaged in a routine television experiment stumbled upon the basic discovery that made possible the Langtry electronic analyser.

By means of it any object however ancient or long-buried may be accurately dated. Hence the popular name “Langtry clock.”

By means of it also, just as a phonograph needle makes possible the projection of sound, the device applied to any object will reproduce the scenes that have taken place before that object.

Before the Dawn describes those projections. They are, mind you, no two-dimensional affairs but diffused in three. The narrator walks in the very midst of the scenes. We are shown the teeming life of the saurians, nature in one of its grand rages of volcanic eruption, of disappearing seas and continents; we see the struggle for existence as it was in the Mesozoic, and the dying gasp of the great reptiles in a gorgeous climax—all, by the literary device, literally through the sensations of an eye-witness.

The Squibb Laboratories announce

IMMUNE GLOBULIN (Human) SQUIBB

For the prevention, modification and early treatment of MEASLES

It has been shown* that the soluble globulins obtained from human placentas by salt extraction, given intramuscularly to susceptible individuals early in the period of incubation (i.e., one to six days after exposure), protect against measles or result in a modification of the disease.

Clinically tested — Immune Globulin (Human) has been tested clinically in over a thousand susceptible children exposed to measles. The results (all of which have not yet been published) indicate that it may be expected to afford protection or modify the disease in over 85 per cent. of cases if administered in recommended dosage.

It is more convenient to use, more uniform in potency and more readily available than convalescent serum or puerperal serum.

Immune Globulin (Human) Squibb is distributed in 2-cc. and 10-cc. vials. Two cc. suffice for one patient, if given not later than the sixth day after exposure.
