The Principles of Bacteriology and Immunity

By W. W. C. TOPLEY, Professor of Bacteriology and Immunology, University of London and G. S. WILSON, Professor of Bacteriology as Applied to Hygiene, University of London

Topley and Wilson's great two-volume work is now $12.00 (formerly $15.00)—in England 50 s—

Part I. GENERAL BACTERIOLOGY
Part II. SYSTEMATIC BACTERIOLOGY
Part III. INFECTION AND RESISTANCE
Part IV. APPLICATIONS TO MEDICINE AND HYGIENE

More than a book—an entire bacteriological library systematically arranged for study and reference.

"A notable production... The material has been well-digested and is presented in an orderly and easily assimilable form, and in far greater detail than in any English or American text-book of reasonable size, with which we are acquainted. ... The inquirer is rarely left in the air."—Lancet (London).

"Thorough, with complete references to medical literature. The history, causes, methods of infection, serology, diagnosis, prevention, and treatment of infectious disorders is fully elucidated. A good index makes reference to any special subject simple."—Journal of the A. M. A.

"The standard British reference volume on the subject... Comprehensive and authoritative... Has advantage over most other presentations in that it includes practical application."—Journal of Laboratory & Clinical Medicine.

For infections due to

**STAPHYLOCOCCUS**

**Staphylococcus Toxoid Squibb**—Prepared by the method of Dolman from several highly toxicogenic strains of staphylococcus. Physiologically tested for harmlessness and for potency. Contains no animal serum and therefore cannot produce sensitivity to any antitoxin or serum. Indicated for the treatment of localized staphylococcus infections and for production of active immunity against recurrent staphylococcus infections. Where there is generalized blood stream infection, Staphylococcus Antitoxin should be used instead. Marketed in 5-cc. rubber-capped vials sufficient for two complete series of average treatments. Each cubic centimeter contains the toxoid derived from at least 1000 necrotizing doses of toxin.

**Staphylococcus Antitoxin Squibb**—Indicated in cases of acute generalized staphylococcus infections where there are signs and symptoms of acute toxemia with no apparent resistance to the spread of the infection as well as an obstinate or spreading localized infection, where the staphylococcal nature of the infection has been confirmed by bacterial examination. In surgical cases, Staphylococcus Antitoxin Squibb will give added protection to the patient and permit adequate surgical drainage. Staphylococcus Antitoxin Squibb is supplied in vials containing 10,000 and 20,000 International Units.
