150 years of progress in tropical medicine

A century and a half is about all that counts in tropical medicine, whereas nature has had millions of years of experiment to find out, that if thwarted in one way she can attain her ends in another.

Because it abounds with intricate problems,

A HISTORY of TROPICAL MEDICINE

in two fine volumes, makes fascinating reading.

It is the first presentation of the subject, written by an eminent physician and a master of the English language, H. Harold Scott, M.D., F.R.C.P., Director, Bureau of Hygiene and Tropical Diseases.

There is nothing remote about this history. Each chapter brings you right up to latest research and treatment. Current problems stand out in full significance.

In 1200 pages you find a wealth of material that is covered by no other publication. The second volume includes fifteen brief biographies of men of repute in the world of tropical medicine.

2 volumes $12.50

A classical example:

Eradication of yellow fever seemed to be simple when the vector was known together with the mode of conveyance of infection. Gorgas acting upon that knowledge cleared up Havana and others effected the same result elsewhere. Then suddenly yellow fever is found where there is no Aedes, no apparent initial case, no overcrowding in a seaport town. Cases are encountered in rural or jungle districts, and the question is all in the melting-pot again.
GRINDING APPARATUS, Latapie, Improved Model. For grinding animal tissues under aseptic conditions. The substances are ground with sufficient fineness for direct injection, if desired. The substance is fed into the cylinder through the opening at top and is gradually forced against the cutting discs by turning the small wheel at left. It is advisable to dilute the substance with distilled water, which is introduced by pressure on the rubber bulb. The material is ground by hand. If motor drive is desired, the hand crank can be removed and a pulley substituted. The liquid is collected in a flask placed under the tubulation to the right as shown in illustration. All parts coming in contact with the tissue are of nickel plated brass, except the cutting discs, which are of steel. The entire apparatus can be readily taken apart for cleaning and sterilization.

4289. Grinding Apparatus, Latapie, as above described, capacity approximately 70 ml, complete with set of three grinding plates, glassware, double bulb, nickel plated stop-cock with Luer syringe needle, rubber tubing and stopper connections as shown in illustration, with detailed directions for use .................................................. 138.00
