ALLERGY, ANAPHYLAXIS
AND IMMUNOTHERAPY

Basic Principles and Practice

By BRET RATNER, M.D., Clinical Professor of Pediatrics, New York University College of Medicine; Visiting Pediatrician and Director of Pediatrics, Sea View Hospital; Associate Attending Children's Medical Service, Bellevue Hospital; Consultant Pediatrician, French Hospital.

Physicians and investigators have waited for a book like this. It spans the wide gaps existing in the texts on allergy, bacteriology, immunity and therapy.

In the new volume you find all the basic principles of allergy, anaphylaxis, shock and present-day immunotherapy which includes such diversified subjects as prophylaxis and treatment of the infectious diseases, sulfonamide therapy, transfusions, blood substitutes, and convalescent sera.

Dr. Ratner proceeds from description of the materials, methods of their preparation, and modes of administration to the details of immunotherapy in more than forty infectious diseases, among them gonococcal infections, meningitis, anthrax, pneumonia.

The second part of the book centers on serum allergy and serum sickness and encompasses the principles of allergy in general.

A unique feature is the graphic exposition of the allergic state in a series of 86 illustrations presented moving-picture-like. The sequence progresses from sensitization and shock reactions of animals all the way to scratch tests and parenteral desensitization in human allergy.

850 pages, 174 illustrations $8.50

The research worker will value particularly the discussion of such subjects as:

1. Anatomy and physiology of the minute vessels of the skin.
2. Leukopenia and eosinophilia—covered more extensively than in most texts on blood cytology.
3. The R H factor in the blood and iso-immunization.
4. The chemistry and nature of serum and serum proteins.
5. The nature and formation of antibodies, antisera, toxins, and toxoids.
6. The nature of homologous blood and blood substitutes.
7. The chemistry, pharmacology and mode of action of sulfonamides.
9. Relation of human and animal anaphylaxis to general shock.
10. Surgical shock and its dynamics.
11. The alarm reaction and counter shock phenomena.
12. The histamine concept of anaphylaxis.
14. Allergy of the central nervous system.
15. Allergy to sulfonamide therapy and its underlying mechanism.
16. Allergy to transfusions.
17. Physiological pathology of the allergic state.
18. The blood chemistry of shock.

The clinical parts of the book keep the investigator in touch with the needs of the practicing physician and show him where further investigation is needed.

The comprehensive bibliography and the carefully prepared index add greatly to the usefulness of the book.

CHEN STAINING ASSEMBLY
FOR HANDLING MICRO COVER GLASS PREPARATIONS

With staining rack of glazed Coors U. S. A. porcelain

STAINING ASSEMBLIES FOR COVER GLASSES, Chen. Convenient and time saving for staining, destaining and dehydrating cover glass preparations, and particularly suitable for use with iron alum and similar solutions which react on metal racks after prolonged exposure. Consisting of a small, stable rack of Coors U.S.A. porcelain, taking twelve cover glasses, removable wire handle and jar, with ground glass cover, of suitable size for economical use of staining solutions. See Tze-Tuan Chen, "A Staining Rack for Handling Cover-Glass Preparations," Stain Technology, Vol. 17, No. 3 (July, 1942), p. 129.

Two types are available, i.e. Type A with narrow grooved bars for supporting the covers at the sides and bottom, taking the most popular sizes of either square or circular cover glasses, and Type B with wide, sloping, grooved sides for all sizes of square and circular covers or for the smaller sizes of rectangles. Type A is offered for 18 and 22 mm cover glasses; Type B jar will accommodate covers up to 22 x 32 mm, but rectangular covers up to 50 mm long can be supported conveniently in the rack provided a suitable container is available. Type B is recommended only for sizes larger than 22 mm. In both types the grooves are approximately 2.5 mm apart and the rack ends are provided with holes near the top for insertion of wire handle for immersing and removing the cover glasses from the jar.

Stender type jar, 93 mm high x 62 mm outside diameter, is regularly included in the assemblies but larger dishes or 8 oz. jars with plastic screw caps are also suitable as containers. The racks will fit into containers with inside diameter of mouth 54 mm or more.

| 9202-A | Staining Assembly for Cover Glasses, Chen, Type A, as above described, for cover glasses 18 or 22 mm only; consisting of Staining Rack 9202-B1, wire handle 9202-C, and Stender Jar, 93 mm high x 62 mm outside diameter, with ground glass cover. For twelve cover glasses, size, mm | 18 | 22 |
| Each | | 2.35 | 2.35 |
| 9202-A2 | Ditto, Type B, as above described, for cover glasses 18 or 22 mm only; consisting of Stainer Rack 9202-B1, wire handle 9202-C, and Stender Jar, 93 mm high x 62 mm outside diameter, with ground glass cover. For twelve cover glasses, size, mm | 18 | 22 |
| Each | | 2.35 | 2.35 |
| 9202-B1 | Staining Rack, Chen, Type A, only, of glazed Coors U.S.A. porcelain, as supplied with 9202-A. Without handle or glass jar. For twelve cover glasses, size, mm | 18 | 22 |
| Dimensions, approximately, mm | 42x30x34 | 41x35x35 |
| Each | | 1.80 | 1.80 |
| 9202-B2 | Ditto, Type B, as supplied with 9202-A2, without handle or glass jar; overall dimensions approximately 40x30x 35 mm. | | |
| Each | | 1.50 | 1.50 |
| 9202-C | Wire Handle, only, of spring brass, 95 mm long. | | |
| Each | | .10 | .10 |

10% discount in lots of 12, one size or catalogue number only.
