Information for Contributors

Manuscripts should be carefully revised and the original should be sent to

DR. JOHN Y. SUGO
Journal of Immunology
Cornell Medical College
1300 York Ave.
New York 21, N. Y.

Authors will be charged for space in excess of 10 printed pages and also for all illustrations and tabular or graphic matter in excess of 10 per cent of the pages in each article.

Author’s alterations of type or illustrations on proof are charged to the author if in excess of an average of $1.00 per printed page; correction of printer’s errors are not charged to the author.

Reprints must be ordered in advance. A table showing cost of reprints, with an order slip is sent with proof. Orders for purchased reprints must be limited to 1,000 copies. The invoice for reprints will also include charges for illustrations, excess pages and tabular matter, if any.

Instructions for the Preparation of Manuscript

Copy should be typed double-spaced on one side only of 8½ x 11 paper. Even material that is to be set in a type size smaller than that of the main text (footnotes, references, etc.) should be double-spaced.

The author should supply a short title for use as a running head. This should be typed on a separate sheet as the first page of manuscript. Type the complete title of the article on a second sheet, and the authors’ names and affiliations on a third sheet. All material that is to be set in a type size different from that of the main text should be typed on separate sheets. This includes tabular matter, case histories, quotations, formulas and other subsidiary matter in the text, footnotes, bibliographies, and legends for illustrations. Displayed formulas which are to be built up to more than one line of type, even if they are the same size type as the text, should be on a separate page. Legends should not be attached to or written on the illustration copy. Positions for tables and figures in the text may be indicated in the margin of the text page.

Manuscripts that do not conform to these instructions will be cut and rearranged so that the matter to be set in different sizes of type can be separated.

Galley proof. Authors will receive galley proofs of their papers set separately as outlined above. Galleys will be arranged in the following order: tables, running heads, footnotes, figure legends, text, bibliography. All material that has been cut from the body of the text will be inserted in its proper place in the galleys. This includes formulas, quotations, case histories, and other subsidiary matter. Manuscript will be arranged in this order: formulas, tables, footnotes, figure legends, text inserts including bibliography, text.

Illustrations. Copy for illustrations should be unmounted glossy photographs clearly identified as to number, author’s name, and top of figure in soft crayon on the back. Graphs should be in India ink on bluelined paper. If larger than 9 x 12, they must be accompanied by glossy photographs within this size.
Calne: RENAL TRANSPLANTATION

From the Foreword by
Joseph E. Murray, Associate Editor,
the journal TRANSPLANTATION:

"The replacement of an old worn-out organ by a new one, once only a dream, now approaches reality . . . Mr. Calne's extensive experimental background and clinical orientation makes his contribution a worthy and valid guide for well-selected, judicious, constructive trials of human kidney transplants . . . [He is] a surgeon by discipline and training, and an imaginative investigator and careful worker . . . admirably suited to undertake this timely monograph."

Successful renal transplants are already on record. It is clear from these that much more work needs to be done. Experimental surgeons, immunologists, irradiation biologists and a host of other researchers and clinicians are building up a vast literature in their search for a really satisfactory procedure. Dr. Calne (whose researches in dog-kidney transplantation have uncovered one of the more promising leads) presents in this timely monograph a clear, thorough review of all clinical and experimental work, some hitherto unpublished.

Westminster Hospital, London
Burnett & Scherp: ORAL MICROBIOLOGY AND INFECTIOUS DISEASE, 2nd edition

This book has been written for dentists, students of dentistry, and dental microbiologists. It will also be of interest to microbiologists, and physicians interested in the oral manifestations of various diseases.

During the last five years a tremendous amount of research has been done in the field of oral microbiology. Drs. Burnett and Scherp have included the most important results of this research in the present edition. For example they present: 1) studies in the systematic relationships of oral microorganisms; 2) a more detailed account of oral microbiota; 3) a resumé or recent ultrastructural investigations of enamel and caries; 4) experimental evidence that caries is an infectious, transmissible disease; and 5) investigations on the influence of diet on the formation of caries.

Microbial classification has been thoroughly revised to conform to the latest edition of Bergey's Manual of Determinative Bacteriology (1957). An outstanding feature of the second edition: almost 250 additional illustrations (photographs and microphotographs of disease states and disease entities) have been included.

CONTENTS—Section I: The Origins, Development and Scope of Microbiology • The origins of microbiology • The development of microbiology • The germ theory of disease • The development of oral microbiology • The scope of microbiology—a perspective • Section II: Systematic Microbiology • The isolation and systematic examination of bacteria in pure culture • Taxonomy • Bacterial cytology • The physiology of bacteria • Bacterial metabolism • Sterilization • Chemotherapy • The general principles of virology • Section III: Infection and Resistance • Infectious diseases as a by-product of parasitism • The nature of virulence • Innate or nonacquired bodily defenses • Acquired body defenses—antibodies and antigens • Serology • Hypersensitivity • Section IV: Oral Infections • The microbial flora of the oral cavity • The general nature of dental caries • Historical theories of the etiology of dental caries • The microbiology of dental caries • Periodontal disease • Infections of the tooth pulp and periapical tissues • Systematic bacterial and protozoan diseases with oral manifestations • Viral and rickettsial diseases with oral manifestations • Mycotic diseases with oral manifestations • Section V: Infectious Diseases • Staphylococci and staphylococcal infections • Streptococci and streptococcal infections • Pneumococci and pneumococcal infections • Pathogenic gram negative cocci • Corynebacterium and the diphtheria bacillus • Mycobacterium • Pasteurella • Brucella and brucellosis • Haemophilus and bordetella • Enterobacteriaceae • Clostridium • The vibrios • Spirochetes • Transitional groups of bacteria • Viral and rickettsial diseases • Protozoa and protozoal infections • Mycotic infections • Index.

By George W. Burnett, B.A., M.A., D.D.S., Ph.D., F.A.C.D., Colonel, Dental Corps, U.S. Army; Chief, Department of Oral Biology; Chairman, Department of Applied Sciences, U.S. Army Institute of Dental Research, Walter Reed Army Medical Center, Washington; and Henry W. Scherp, B.S., M.S., Ph.D., Chief, Laboratory of Microbiology, National Institute of Dental Research, Bethesda 1962 • 1010 pp., 500 figs. • $13.00
