Information for Contributors

Manuscripts should be carefully revised and the original should be sent to

Dr. John Y. Sugg
Journal of Immunology
Cornell Medical College
1300 York Ave.
New York, N.Y. 10021

Authors will be charged for space in excess of 10 printed pages and also for all illustrations and tabular or graphic matter in excess of 10 per cent of the pages in each article.

Author's alterations of type or illustrations on proof are charged to the author if in excess of an average of $1.00 per printed page; correction of printer's errors are not charged to the author.

Reprints must be ordered in advance. A table showing cost of reprints, with an order slip is sent with proof. Orders for purchased reprints must be limited to 1,000 copies. The invoice or reprints will also include charges for illustrations, excess pages and tabular matter, if any.

Instructions for the Preparation of Manuscript

Copy should be typed double-spaced on one side only of 8\(\frac{1}{2}\) x 11 paper. Even material that is to be set in a type size smaller than that of the main text (footnotes, references, etc.) should be double-spaced.

The author should supply a short title for use as a running head. This should be typed on a separate sheet as the first page of manuscript. Type the complete title of the article on a second sheet, and the authors' names and affiliations on a third sheet. All material that is to be set in a type size different from that of the main text should be typed on separate sheets. This includes tabular matter, case histories, quotations, formulas and other subsidiary matter in the text, footnotes, bibliographies, and legends for illustrations. Displayed formulas which are to be built up to more than one line of type, even if they are the same size type as the text, should be on a separate page. Legends should not be attached to or written on the illustration copy. Positions for tables and figures in the text may be indicated in the margin of the text page.

Manuscripts that do not conform to these instructions will be cut and rearranged so that the matter to be set in different sizes of type can be separated.

Galley proof. Authors will receive galley proofs of their papers set separately as outlined above. Galleys will be arranged in the following order: tables, running heads, footnotes, figure legends, text, bibliography. All material that has been cut from the body of the text will be inserted in its proper place in the galleys. This includes formulas, quotations, case histories, and other subsidiary matter. Manuscript will be arranged in this order: formulas, tables, footnotes, figure legends, text inserts including bibliography, text.

Illustrations. Copy for illustrations should be unmounted glossy photographs clearly identified as to number, author's name, and top of figure in soft crayon on the back. Graphs should be in India ink on bluelined paper. If larger than 9 x 12, they must be accompanied by glossy photographs within this size.
GOOD AND GABRIELSEN'S THE THYMUS IN IMMUNOBIOLOGY
STRUCTURE, FUNCTION AND ROLE IN DISEASE

Since a new era in thymus research was ushered in as a result of the clinical and experimental findings of the last few years, this new book is the first to focus on the tremendous amount of work that has been done and to review the widely scattered literature.

The book not only embodies the major contributions in the "new wave" of thymus research, but it also offers an unusual review of the pre-1961 work, going back in many instances to classical studies done early in the century.

Based on a symposium which brought together seventy-two eminent investigators, the book is concerned chiefly with the newly discovered role of the thymus and the bursa of Fabricius—a thymus-like organ found in birds—in the development of immunologic capacity.

The major areas of thymus and bursa investigation are included, with authoritative discussions on the anatomy, histology, and embryology of these tissues, their function in relation to other hematopoietic tissues, and their role in leukemogenesis.

By 72 Authorities. Edited by ROBERT A. GOOD, Ph.D., M.D., American Legion Heart Research Professor of Pediatrics and Microbiology, University of Minnesota Medical School and ANN E. GABRIELSEN, M.A., Research Fellow, Department of Pediatrics, University of Minnesota Medical School. 800 pages, 429 illustrations, $24.50

MCKAY'S DISSEMINATED INTRAVASCULAR COAGULATION
AN INTERMEDIARY MECHANISM OF DISEASE

This important new book presents the clinical, hematologic, pathologic, and experimental evidence to demonstrate the phenomenon of disseminated intravascular coagulation in apparently unrelated disease states.

The beginning of the book is concerned with a number of cases encountered clinically. The succeeding sections deal with animal experiments that correspond to the clinical diseases and to the conclusions concerning mechanisms that have been drawn from both clinical conditions and animal experiments.

You will find that a further subdivision into certain known etiologic factors has been made in both clinical cases and animal experiments, including intravascular hemolysis, tissue extracts, bacterial toxins, antigen-antibody complexes, chemical or physical agents in the circulating blood, anoxia and anoxemia, and endothelial damage.

For clinicians in a variety of fields, hematologists, pathologists, and for those concerned with research.

By DONALD G. MCKAY, M.D., Professor and Head, Department of Pathology, Columbia University College of Physicians and Surgeons. 508 pages, 204 illustrations (7 in color), $16.00

EICHELBERGER'S LABORATORY METHODS IN BLOOD COAGULATION

Foreword by William H. Crosby, M.D. For all concerned with the laboratory diagnosis of coagulation disorders, this new manual is an indispensable aid at the workbench and an invaluable teaching guide for students. Now, for the first time, technologists and students can have at their fingertips a step-by-step "cookbook" approach to clotting procedures and diagnostic methods. By JAMES W. EICHELBERGER, Jr., Coagulationist, Walter Reed Army Medical Center, Washington, D. C. 96 pp., illus., $2.95

Andrewes:

VIRUSES OF VERTEBRATES

By Sir Christopher Andrewes, M.D., F.R.C.P., F.R.S., Wellcome Trust Fellow; Formerly Deputy Director, National Institute for Medical Research, Mill Hill, London.

For some time, researchers and practitioners have noted an acute need for a book in virology which would correspond to Bergey's Manual and its place in bacteriology. Now, The Williams & Wilkins Company is proud to announce that this book has been written by Sir Christopher Andrewes—a man who enjoys the reputation of being "the dean of viral nomenclature" the world over.

 Viruses of Vertebrates is a new book of major importance, and will become the standard reference in its field. It provides essential information on all viruses which affect man and other vertebrates, and thus is invaluable for researchers, workers in university and diagnostic laboratories, public health workers, and both veterinary and medical students.

Divided into four sections, it is so planned that the facts about each virus are gathered under twelve standard headings. Pathogenic effects are considered only in so far as they are required to identify a virus and indicate its importance. This, however, necessitates considerable space devoted to disease-producing powers since it is largely by their deeds that they are known.

1964 420 pp., 5 tables $11.50
