focus on fluorescence

Microbiologists tell us that reactions are more sharply defined with B-B-L "performance-tested" reagents which make antigen-antibody reactions more clearly visible by fluorescence microscopy — with less nonspecific background interference.

Foremost in fluorescent antibody techniques, B-B-L was FIRST with chromatographically-pure labeling compounds FIRST with all reagents for the FTA test FIRST with high-quality fluorescein-labeled anti-rabies globulin.

"And now, FIRST AGAIN with lyophilized, Fluorescein-Labeled Test Reagent for Group A Streptococcus — a specific reagent designed for use in the one-step fluorescence-inhibition method.

This mist is a must

It's Ninspray. An 0.5% solution of a reagent grade of Ninhydrin in Butanol. A must for up-to-the-minute qualitative and quantitative Amino Acid chromatography. Because it's dependable, convenient and economical. Ninspray aerosol reagent excels in the detection of fingerprints, according to the procedure of Oden and Hoffsten, Nature 178, 449 (1954), and Chemical Abstracts 48, 692e (1954).
