READY...SET TO GO!

THE NALGENE®
FILTER UNIT*

When you open the sterile package, this complete membrane filter assembly is ready for immediate use... for microfiltrations and microanalyses. Everything you need is included—even the Metrical® membrane filter. Just attach a vacuum source. When you’re finished... throw the filter unit away. The next one is sitting on your shelf—just as sterile, just as ready. No more hours spent assembling, autoclaving, cooling. No risk of damaging membranes. The new Nalgene Filter Unit is packaged, sterile, ready to use and disposable. Available with 0.20 micron plain or 0.45 micron grid membranes. Only $9.00 per shelf pack of 12. For complete information, use the coupon.

Lamanna & Mallette:
BASIC BACTERIOLOGY—

Its Biological and Chemical Background, 3rd ed.

In 1953 the first edition of Drs. Lamanna and Mallette's book, Basic Bacteriology, appeared and a need which had long existed, the need for a textbook that bridged the gap between the basic elements of the science and the more complex, advanced problems, was filled. Its painstaking efforts "to explain bacteriologic phenomena rather than merely to state their occurrence" granted the book immediate and widespread acceptance.

The authors have updated the new edition to maintain the highest level of accuracy, completeness and utility; this in spite of the tremendous advances made in recent years. The book's original format, which first explains simple principles by which the reader can grasp more complex ideas, has been adhered to. All the significant advances in bacteriologic knowledge and experimental techniques since 1959 have been analyzed and incorporated. Major additions and revisions have been made in the areas of numerical taxonomy, enzyme biosynthesis and nomenclature, metabolism of nitrogen compounds, photosynthesis, genetics and permeability phenomena.

By Carl Lamanna, Ph.D., Scientific Advisor, Life Sciences Division, Office of Chief of Research and Development, Department of the Army; and M. Frank Mallette, Ph.D., Professor of Biochemistry, The Pennsylvania State University.

1965 $17.50

The Best of Two Methods and Two Media: IMMUNODIFFUSION - ELECTROPHORESIS

**Titragar®**
An immunodiffusion device using agar and incorporating the serial dilution technique. Detects immunological differences of protein components to 1/4 gamma.

**Agafor®**
For use with agar on microscope or lantern slides. The standard instrument in almost all laboratories and furnished complete with cell, power supply, agar cutter, viewer, pattern holders, humidifying chamber, and projector.

**Cellulose Acetate**

**Immunocell®**
A clamp-on arrangement for cellulose acetate sheets, combined with serial dilution, which reduces incubation time, eliminates the chores of older methods, and yields precipitate lines of high resolution and clarity.

**Cellofor®**
An immunoelectrophoresis apparatus for use with cellulose acetate. Central clamp-on cell may be purchased separately and can be inserted in Agafor or other migration chambers. Eliminates handling, sample applicators, humidifying cabinets, and pipette dilutions.

**Bulletins**
- 5-2700 Vertiphorator (Vertical Gel Apparatus)
- 3-2000 Takatsy Microtitrator for Serial Dilution
- 5-2900 Ednalite Photoview for All Transparencies
- 5-2040 Universal Projector

Paul:

CELL AND TISSUE CULTURE, 3rd ed.

The second edition of Dr. Paul's Cell and Tissue Culture has received widespread acclaim as the most complete, definitive, and up to date account of the techniques and applications of tissue culture available. Yet, the rapid developments in the field have necessitated still further revision. In his new edition the author has incorporated all recent accurate and noteworthy material. Because of increased interest in organ cultures and large-scale cell cultures, there is now a chapter devoted to each of these topics. Some sections have been rearranged in a more logical format with a view to emphasizing the basic similarities in methods used for a wide variety of materials. Some outdated matter has given way to new, and the bibliographies have been extensively revised.

"This little manual represents the most up-to-date and comprehensive survey now available of the methods used to maintain cells and tissues outside the parent body. In small compass it offers a mine of practical information, and it is particularly excellent in point of view . . . the style is direct, simple and clear—an excellent thing in science. No other text on tissue culture has so wide or such well-balanced coverage; much useful knowledge awaits the reader of this sustaining book."—American Scientist review of the 1st ed.

By John Paul, F.R.S.E., M.B., Ch.B., Ph.D., M.R.C.P.Ed., M.C.Path., Titular Professor in the Department of Biochemistry, University of Glasgow; Director, Tissue Culture Association Summer Course, 1957–60.

1965 384 pp., 159 figs. $6.75
14 Major Innovations in the NEW Model F Coulter Counter®

1. Twin monitoring system / (a) all size changes are readily observed on the oscilloscope screen (b) "debris" blocking the aperture is instantly shown as a projected image on the optical monitor
2. One unit / everything including "glassware" incorporated in one case
3. Compact size / only 13½" wide
4. Coulter-designed transistorized circuitry
5. "Snap-in" circuitry readily replaceable by user
6. "Snap-in" power supply readily replaceable by user
7. Completely separate manometer with quick "clip-off" procedure
8. Replaceable scope circuitry
9. Trouble-free micro-projection system
10. Simple 2-step operation
11. Audible check / count rate changes indicated by tone signal
12. Highest reproducability / easily rechecked
13. Accurately counts at a rate of 6,000 individual cells per second
14. The most reliable counting equipment ever developed

The new Model F Coulter Counter has been designed to the requirements of efficient laboratory procedure. High production counting or smaller production needs, the new Model F means never-before economy, accuracy, speed, reliability.

Fluorescein Isothiocyanate (FIC) fluorescent antibody techniques have proven valuable in the diagnosis of various communicable diseases, polio, rabies and typhoid, the identification of antigens, microorganisms and as a research tool in probing the mechanisms of antibody formation and cytochemical studies on the distribution of homologous proteins in tissues and organs.

Previously, however, investigators using the fluorescent antibody technique have been annoyed with non-specific green fluorescence of certain tissue or with non-specific uptake of fluorescein conjugate.

Recently, a counterstaining procedure for use in conjunction with FIC has been reported by Hall and Hanson (1). This method utilizes aluminum chelates of dihydroxy azo dyes.

Now, NBCo offers the entire group of azo dyes in convenient kit form: (An assortment of 5 grams each of the listed counter stains for $6.25.)

- Flazo Orange
- Superchrome Blue B Extra
- Diamond Red ECB.— Extra Coné
- Diamond Black
- Pontachrome Blue Black ZF
- Pontachrome Violet SW
- Acid Alizarin

**Fluorescent Labeling**

For the convenience of laboratories desiring a complete initial stock, NBCo offers an assortment of one each of the following biochemicals in 100 mg. ampuls at $12.50:

- 5 Dimethyl Amino-1 Naphthalene Sulfonoyl Chloride on Celite 10%
- Fluorescein Isothiocyanate on Celite 10%
- Rhodamine B Isothiocyanate on Celite 10%
- Rosamine B 4' Isothiocyanate on Celite 10%
- Fluorescein Amino (Fraction I or II)
- Fluorescein Isothiocyanate
- Rhodamine B Isothiocyanate
- Rosamine B 4' Isothiocyanate
- 5 Dimethyl Amino-1-Naphthalene-1 Sulfonoyl Cl (DNS)

Phone collect, 216-662-0212 (U.S.A. only.) NBCo guarantees shipment within 60 minutes of your call, one-day delivery anywhere in the continental U.S.A., 80 hours anywhere in the world. Send for our free catalog containing more than 3000 items.
