Supplementary Figure 1. Monocyte viability. (A) Human monocytes were stimulated with TNF (10 ng/ml) for the indicated times then cell viability measured by MTS. Monocyte viability was measured at 24 h after (B) Nfat2 siRNA transfection or (C) BAY 11-7082 (10 μM) treatment, with or without TNF (10 ng/ml) stimulation, as indicated. Data represent the means ± SEM from three separate experiments.
