On the cover: Effector/memory T cells (red) probe for Ag by extending invadosome/podosome-like protrusions (ILPs) against apposing cells. ILPs seem to facilitate initial Ag recognition by enforcing the requisite close intercellular contacts. ILPs also help to sustain subsequent responses to Ag by forming stabilized arrays termed “podo-synapses.” Sage, P. T., L. M. Varghese, R. Martinelli, T. E. Sciuto, M. Kamei, A. M. Dvorak, T. A. Springer, A. H. Sharpe, and C. V. Carman. 2012. Antigen recognition is facilitated by invadosome-like protrusions formed by memory/effector T cells. *J. Immunol.* 188: 3686–3699.
