On the cover: Predicted interaction of the defense endogenous neuropeptide urocortin II (UCNII) and the bacterial lipopolisaccharide (LPS). The polysaccharide moiety of the two LPS-interacting clusters (red and green structures) bind with high affinity with the same surface of UCNII (gray), which concentrates the cationic residues orientated in that side of the molecule. Campos-Salinas, J., M. Caro, A. Cavazzuti, I. Forte-Lago, S. M. Beverley, F. O’Valle, and E. Gonzalez-Rey. 2013. Protective role of the neuropeptide urocortin II against experimental sepsis and leishmaniasis by direct killing of pathogens. *J. Immunol.* 191: 6040–6051
