On the cover: Intravital 2 photon imaging of islet-Ag-specific T cells (green) in a prediabetic NOD mouse pancreatic islet during autoimmune attack. Vasculature is labeled with dextran-rhodamine (red). Increasing islet infiltration is associated with accelerated T cell motility in the islets due to loss of T cell interactions with APCs. Antigen recognition in the islets changes with progression of autoimmune islet infiltration. *J. Immunol.* 194: 522–530.
