AUTOIMMUNITY

- 579 Uncovering a Shared Epitope–Activated Protein Citrullination Pathway
Vincent van Drongelen, Wahida H. Ali, and Joseph Holoshitz

On the cover: H&E stained image of *Trypanosoma cruzi*-infected skeletal muscle following doxycycline-induced MHC class I overexpression. Initially, overexpression specifically in skeletal muscle increases CD8⁺ T cell surveillance and in vivo effector function and significantly reduces infection intensity. However, prolonged overexpression (>30 d) compromises systemic parasite control in a PD-L1–dependent manner. Pack, A. D., and R. L. Tarleton. 2020. Cutting edge: augmenting muscle MHC expression enhances systemic pathogen control at the expense of T cell exhaustion. *J. Immunol.* 205: 573–578.
