On the cover: Double immunofluorescence staining of a lesional psoriatic skin section reveals an inflammatory increased expression of ERAP1 (green) in the melanocytes (red) and germinative keratinocytes (nuclei in blue) of the basal epidermal cell layer, which is particularly strong in melanocytes (red, yellow overlay), indicating increased Ag processing. Arakawa, A., E. Reeves, S. Vollmer, Y. Arakawa, M. He, A. Galinski, J. Stöhr, K. Dornmair, E. James, and J. C. Prinz. ERAP1 controls the autoimmune response against melanocytes in psoriasis by generating the melanocyte autoantigen and regulating its amount for HLA-C*06:02 presentation. *J. Immunol.* 207: 2235–2244.
