

Supplement Fig.1

Supplemental figure 1 Upon activation, cytokine production by iNKT cells from IFN- γ , IL-4, or IL-10-deficient mice is comparable to that from WT B6 mice except for knock-out target cytokine. The liver mononuclear cells obtained from IFN- γ ^{-/-}, IL-4^{-/-}, IL-10^{-/-} or WT B6 mice were stimulated with α -GalCer (200ng/ml) for 24 hr. The amounts of IFN- γ , IL-4, and IL-10 were measured in the culture supernatant using ELISA.
